Chronic disease

Prepared by:

**Dr.: Sahar Mahmoud Sayed
Ahmed**

Out line:

- Introduction
- Definition
- Characteristic of chronic disease.
- Important of chronic diseases in community health.
- Examples of chronic diseases.
- Causes and Risk factors.
- Prevention Strategy at the community level.
- Role of the C.H.N in care of patient with chronic disease.
- Levels of prevention to decrease chronic diseases.

Introduction:

Chronic diseases constitute a major cause of mortality , the (WHO) reports chronic non-communicable conditions leading to cause of mortality in the world. Therefore public health programs are important in educating the public, and promoting healthy lifestyles and awareness about chronic diseases. chronic diseases are the most common and costly health problems, so it must prevent and effectively controlled.

Definition:-

- **Chronic disease:** A disease that persists for a long time. A chronic disease is one lasting 3 months or more. It generally cannot be prevented by vaccines or cured by medication, or rarely cured completely.
- **The term chronic** is usually applied when the course of the disease lasts for more than three months.

Characteristic of chronic disease:

- Being permanent.
- Leave residual disability.
- Caused by a non-reversible pathologic alteration.
- Long period of supervision and care.

Impact of chronic diseases in community health

1. **Economic impact:** the presence of a chronic disease within a family causes a burden to family and community both financial and economically.
2. The morbidity and mortality rates from chronic diseases are increasing

3-The chronically ill person may feel socially isolated and unable to fill his usual family roles.

4- The increase in the life span of people lead to the increased number of elderly people and consequently the growing incidence of chronic diseases.

Examples of chronic diseases include:

- Alzheimer's disease, Parkinson's disease
- Cancer
- Cardiovascular diseases
- Hypertension
- Cerebral palsy (all types)
- Diabetes mellitus
- Mental illness
- Epilepsy
- Chronic hepatitis
- Osteoporosis

Causes of chronic diseases

are unknown

Risk factors as:

- Age and gender
- Bad dietary habits and metabolic risk factors
- Lifestyle as lack of exercise or physical activity
- Tobacco use as smoking and drinking alcohol
- Air pollution.

- Social factors, e.g., socioeconomic status, education level, and race
- Hereditary factor.
- Premature birth and injury at birth.
- Occupational factors.

Prevention Strategy of chronic diseases at the community level:

- Building healthier and safer environments in the communities.
- Eliminating health disparities.
- Helping individuals in making healthy choices.
- Increasing coverage and access to medical services.
- Expanding coverage for clinical preventive services recommended on the base of their proven health benefits

Role of the C HN in care of the patient with chronic disease

The community health nurse works with chronically ill patient in a wide variety of setting as home visit, MCH centers, outpatient clinic, schools and occupational area. She can play a vital role as key mobilizes in empowering chronically ill patient, and working with community to take control of progressive chronic diseases.

The objectives of patient with chronic disease care are:

- To mobilization and coordinate community and family care efforts.
- To maintain the ability to function in both patient and family.
- To support the patient's care regimen
- To observe and report new pattern or unexpected occurrences.
- To reduce patient and family stress result from illness and eventual separation.

Assessment:

The community health nurse collects data about:

- The nature of the disease, etiology, signs and symptoms, method of diagnoses, care and treatment.
- Distribution among the population by sex, age, and occupation, attitude and health awareness of the public toward chronic diseases.
- Morbidity and mortality.

Planning

- Determine the needs and set them in priority.
- Determine the extended of the problems.
- Establish with others involved in the care, reasonable goals for the restoration of physical function for the patient.
- Increase her own skill in the care of chronic disease patient by self-initiated training or by working with agency personnel such as physical therapist.

Implementation:

- The community health nurse helps in the early case finding and early diagnosis of chronic disease.
- Educate the public about signs and symptom of chronic disease, importance of early diagnosis and measures for control as available resources and services.
- Educate the public about the value of periodic medical checkup for early detection of chronic disease.

Evaluation:

The community health nurse must be do periodic evaluation of the effectiveness nursing activities in meeting the needs of the patients and a achieving the established goals.

levels of prevention to decrease chronic diseases

Primary level of prevention: to achieve health promotion for community members and disease prevention.

1. General health promotion
2. Specific protection

1) General health promotion

by health legislation and community development social care to community members:

A-Improving of physical environment for people as clean, organized and quiet home, environment must be characterized by safe, good ventilation, good sanitation for food and water, waste disposal and no pollution

B-Health education about

1. Nutrition as important and function of nutrition, component of good nutrition, avoid bad habits of feeding to improve immune system.
2. Hygiene as hand washing, bathing, mouth care,
3. Exercise and sport they do any exercise daily to improve circulation and avoid over weight.
4. Sleep and rest must take suitable time of sleep.
5. Apply healthy life styles as avoid smoking, alcohol and
6. Periodic checkup as full checkup annually.
7. Use stress management techniques

2-Specific protection as:

- Immunization (active or passive)
- Chemoprophylaxis as vitamins and antibiotic
- Nutritional supplementation for high risk group.
- International measures as prevent travel to epidemic area.
- Apply universal precautions and infection control instructions and wearing protective clothes for health care workers

Secondary level of prevention

- Early detection & early case finding to any person with chronic diseases by:
 - ❖ Survey study for high risk people to chronic diseases.
 - ❖ Screening program for people high risk to chronic diseases (mass, selective, opportunistic).
 - ❖ Annual checkup for community members.

- **Early treatment** to any patient with chronic diseases by :
 - Medical intervention
 - Nursing intervention.

Tertiary level of prevention

- Prevent of complication or disability by:
 - ❑ Continuous follow up for patient with chronic diseases after treatment to observe and manage prognoses of diseases and any complications.
 - ❑ Early treatment of associated S&S and side effect of chronic diseases.

Rehabilitation

- ✓ Medical or physical rehabilitation.
- ✓ Vocational rehabilitation.
- ✓ Social rehabilitation.
- ✓ Psychological rehabilitation.
- ✓ occupational rehabilitation

**THANK
YOU**
